## 1. Introduction

### 1.1 Overview

The Unbreakable Enterprise Kernel (UEK), included as part of Oracle Linux, provides the latest open source innovations, key optimizations and security for enterprise cloud workloads. This Linux kernel powers Oracle Cloud and Oracle Engineered Systems such as Oracle Exadata Database Machine. Oracle tests UEK intensively with demanding Oracle workloads, and recommends UEK for Oracle deployments and all other enterprise deployments.

Oracle contributes to upstream Linux kernel development with enhancements that benefit Oracle Database, middleware, applications and hardware, as well as our broad partner ecosystem. These enhancements are distributed to customers through UEK for Oracle Linux.

By selectively integrating the latest open source Linux capabilities into UEK while still providing application binary compatibility with the Red Hat Compatible Kernel, Oracle makes it easy to run the most demanding cloud and enterprise workloads without compromising stability and security. We test all our on-premises software, and run Oracle Cloud on UEK, ensuring you can achieve the highest scalability and performance with your current workloads and those of the future.

This document is the Security Policy for the Oracle Linux Unbreakable Enterprise Kernel (UEK) Cryptographic Module by Oracle Corporation. Oracle Linux UEK Cryptographic Module is also referred to as “the Module or Module”. This Security Policy specifies the security rules under which the module shall operate to meet the requirements of FIPS 140-2 Level 1. It also describes how the Oracle Linux UEK Cryptographic Module functions in order to meet the FIPS requirements, and the actions that operators must take to maintain the security of the module.

This Security Policy describes the features and design of the Oracle Linux UEK Cryptographic Module using the terminology contained in the FIPS 140-2 specification. FIPS 140-2, Security Requirements for Cryptographic Module specifies the security requirements that will be satisfied by a cryptographic module utilized within a security system protecting sensitive but unclassified information. The NIST/CSE Cryptographic Module Validation Program (CMVP) validates cryptographic module to FIPS 140-2. Validated products are accepted by the Federal agencies of both the USA and Canada for the protection of sensitive or designated information.

### 1.2 Document Organization

The Security Policy document is one document in a FIPS 140-2 Submission Package. In addition to this document, the Submission Package contains:

- Oracle Linux Unbreakable Enterprise Kernel (UEK) Cryptographic Module Non-Proprietary Security Policy
- Other supporting documentation as additional references

With the exception of this Non-Proprietary Security Policy, the FIPS 140-2 Validation Documentation is proprietary to Oracle and is releasable only under appropriate non-disclosure agreements. For access to these documents, please contact Oracle.

## 2. Oracle Linux Unbreakable Enterprise Kernel Cryptographic Module

### 2.1 Functional Overview

The Oracle Linux Unbreakable Enterprise Kernel Cryptographic Module is a software only cryptographic module that provides general-purpose cryptographic services to the remainder of the Linux kernel. The Oracle Linux UEK Cryptographic Module is software only, security level 1 cryptographic module, running on a multi-chip standalone platform.

### 2.2 FIPS 140-2 Validation Scope

The following table shows the security level for each of the eleven sections of the validation. See Table 1 below.

Security Requirements Section	Level
Cryptographic Module Specification	1
Cryptographic Module Ports and Interfaces	1
Roles and Services and Authentication	1
Finite State Machine Model	1
Physical Security	N/A
Operational Environment	1
Cryptographic Key Management	1
EMI/EMC	1
Self-Tests	1
Design Assurance	3
Mitigation of Other Attacks	N/A

**Table 1: FIPS 140-2 Security Requirements**

### 3. Cryptographic Module Specification

#### 3.1 Definition of the Cryptographic Module

The Oracle Linux UEK Cryptographic Module is a software-only multi-chip standalone module as defined by the requirements within FIPS PUB 140-2. The logical cryptographic boundary of the module consists of binary files and their integrity check HMAC files, which are delivered through the Oracle Public Yum Package Manager (RPM) as listed below:

The list of components required for the module version R7-2.0.0 running on Oracle Linux 7.3 to operate are defined below:

- Oracle Linux Unbreakable Enterprise Kernel Cryptographic Module with the version of the RPM file [kernel-uek-4.1.12-124.16.4.el7uek](#).
- The configuration of the FIPS mode is provided by the dracut-fips and dracut-fips-aesni package with the version of the RPM file of 033-535.0.2.el7.x86\_64.
- The bound module Oracle Linux NSS Cryptographic Library with FIPS 140-2 Certificate #[3143](#) (hereafter referred to as the “NSS bound module” or “NSS module”)
- The contents of the hmaccalc RPM package version 0.9.13-4.el7.x86\_64

The list of components required for the module version R6-1.0.0 running on Oracle Linux 6.9 to operate are defined below:

- Oracle Linux Unbreakable Enterprise Kernel Cryptographic Module with the version of the RPM file [kernel-uek-4.1.12-124.16.4.el6uek](#).
- The configuration of the FIPS mode is provided by the dracut-fips package with the version of the RPM file of 004-409.0.8.el6\_8.2.x86\_64.
- The bound module Oracle Linux NSS Cryptographic Library with FIPS 140-2 Certificate #[3111](#) (hereafter referred to as the “NSS bound module” or “NSS module”)
- The contents of the hmaccalc RPM package version 0.9.12-2.el6.x86\_64

The Oracle Linux UEK RPM package of the Module includes the binary files, integrity check HMAC files and Man Pages. The files comprising the module are the following:

- kernel loadable components /lib/modules/\$(uname -r)/kernel/crypto/\*.ko
- kernel loadable components /lib/modules/\$(uname -r)/kernel/arch/x86/crypto/\*.ko
- static kernel binary /boot/vmlinuz-\$(uname -r)
- static kernel binary HMAC file /boot/.vmlinuz-\$(uname -r).hmac
- sha512hmac binary file for performing the integrity checks /usr/bin/sha512hmac
- sha512hmac binary HMAC file: /usr/lib64/hmaccalc/sha512hmac.hmac

The NSS bound module provides the HMAC-SHA-512 algorithm used by the sha512hmac binary file to verify the integrity of both the sha512hmac file and the vmlinuz (static kernel binary).

Figure 1 shows the logical block diagram of the module executing in memory on the host system. The dotted line indicates the logical boundary of the module.

**Figure 1: Oracle Linux UEK Logical Cryptographic Boundary**

### 3.2 Definition of the Physical Cryptographic Boundary

The physical cryptographic boundary is defined as the hard enclosure of the host system on which it runs. See the dotted line in figure 2 below. No components are excluded from the requirements of FIPS PUB 140-2.

**Figure 2: Oracle Linux UEK Hardware Block Diagram**

### 3.3 Modes of Operation

The module supports two modes of operation: the FIPS approved and non-approved modes.

Section 10.1.1 describes the Secure Installation and Startup to correctly install and configure the module. The module turns to FIPS approved mode after correct initialization, successful completion of power-on self-tests.

Invoking a non-Approved algorithm or a non-Approved key size with an Approved algorithm as listed in Table 4 will result in the module implicitly entering the non-FIPS mode of operation.

The approved services available in FIPS mode can be found in section 7.2 **Table 8**. The non-approved services not available in FIPS mode can be found in section 7.3 .

### 3.4 Approved or Allowed Security Functions

The Oracle Linux UEK Cryptographic Module contains the following FIPS Approved Algorithms:

Approved or Allowed Security Functions		Certificate	
<i>Symmetric Algorithms</i>		OL 7.3	OL 6.9
AES	<p><b>(aesasm):</b> <b>CBC, ECB</b> (e/d; 128, 192, 256); <b>CTR</b> (ext. only; 128, 192, 256) <b>CCM</b> (KS: 128, 192, 256) (Assoc. Data Len Range: 0 - 0, 2^16) (Payload Length Range: 0 - 32 (IV Length(s): 56, 64, 72, 80, 88, 96, 104 (bits) (Tag Length(s): 32, 48, 64, 80, 96, 112, 128 (bits) <b>GCM</b> (KS: AES_128, AES_192, AES_256) (d) Tag Length(s): 128 120 112 104 96 64 32) PT Lengths Tested: (0, 120, 128, 248, 256); AAD Lengths tested: 0, 120, 128, 248, 256); 96BitIV_Supported GMAC_Supported</p> <p><b>XTS</b> ((KS: XTS_128, XTS_256) ((e/d) (f))</p>	<a href="#">5400</a> <a href="#">5621</a>	<a href="#">5614</a> <a href="#">5631</a>
	<p><b>aesasm_iiv:</b> <b>CBC, ECB</b> (e/d; 128, 192, 256); <b>CTR</b> (ext. only; 128, 192, 256)</p> <p><b>GCM</b> (KS: AES_128, AES_192, AES_256) Tag Length(s): 128 96 64) IV Generated: (Internally (using Section 8.2.1)); PT Lengths Tested: (120, 128, 248, 256); AAD Lengths tested: (64, 96); 96BitIV_Supported</p>	<a href="#">5423</a> <a href="#">5622</a>	<a href="#">5615</a> <a href="#">5632</a>

**Table 2: FIPS Approved or Allowed Security Functions**

### 3.5 Non-Approved but Allowed Security Functions

The following algorithm is considered non-Approved but allowed to be used in a FIPS-approved mode:

Algorithm	Usage
NDRNG from Linux RNG	Used for seeding NIST SP 800-90A DRBG

**Table 3: Non-Approved Disallowed Functions**

### 3.6 Non-Approved Security Functions

The following algorithms are considered non-Approved and may not be used in a FIPS-approved mode of operation. The services associated with these algorithms are specified in section 7.3.

Algorithm	Usage
AES-XTS (192 bit)	Encrypt/Decrypt
AES GCM	Encryption with external IV or using aesni implementation
DES	Encrypt/Decrypt
SHA-1 (multiple-buffer)	Message Digest
ANSI X9.31 RNG	Random Number Generation
Jitter RNG	Non-Deterministic Random Number Generation

**Table 4: Non-Approved Disallowed Functions**

## 4. Module Ports and Interfaces

The module interfaces can be categorized as follows:

- Data Input Interface
- Data Output Interface
- Control Input interface
- Status Output Interface

The module can be accessed by utilizing the API it exposes. Table below, shows the mapping of ports and interfaces as per FIPS 140-2 Standard.

FIPS 140 Interface	Module Interfaces
Data Input	API input parameters
Data Output	API output parameters
Control Input	API function calls, kernel command line
Status Output	API return codes, kernel logs

**Table 5: Mapping of FIPS 140 Logical Interfaces to Logical Ports**

## 5. Physical Security

The Module is comprised of software only and thus does not claim any physical security.

## 6. Operational Environment

### 6.1 Tested Environments

The module operates in a modifiable operational environment per FIPS 140-2 level 1 specifications. The Module was tested on the following environments with and without PAA i.e. AES-NI:

Module Version	Operating Environment	Processor	Hardware
R7-2.0.0	Oracle Linux 7.3 64 bit	Intel(R) Xeon(R) E5-2699 v4	Oracle Server X6-2
R6-1.0.0	Oracle Linux 6.9 64 bit	Intel(R) Xeon(R) E5-2699 v4	Oracle Server X6-2
R7-2.0.0	Oracle Linux 7.3 64 bit	Intel(R) Xeon(R) Silver 4114	Oracle Server X7-2
R6-1.0.0	Oracle Linux 6.9 64 bit	Intel(R) Xeon(R) Silver 4114	Oracle Server X7-2

**Table 6: Tested Operating Environment**

### 6.2 Vendor Affirmed Environments

The following platforms have not been tested as part of the FIPS 140-2 level 1 certification however Oracle “vendor affirms” that these platforms are equivalent to the tested and validated platforms. Additionally, Oracle affirms that the module will function the same way and provide the same security services on any of the systems listed below.

Operating Environment	Processor	Hardware
Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600/E5-2600 v2	Cisco UCS B200 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600 v3 & v4	Cisco UCS B200 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® Scalable Processors	Cisco UCS B200 M5
Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2400/E5-2400 v2	Cisco UCS B22 M3
Oracle Linux 7.3 64-bit	Intel® Xeon® E7-2800/E7-8800	Cisco UCS B230 M2
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E7-2800/E7-8800 v3	Cisco UCS B260 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-4600/E5-4600 v2	Cisco UCS B420 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-4600 v3 & v4	Cisco UCS B420 M4
Oracle Linux 7.3 64-bit	Intel® Xeon® E7-2800/E7-8800	Cisco UCS B440 M2
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E7-2800 v2/E7-4800 v2/E7-8800 v2/E7-4800 v3/E7-8800 v3	Cisco UCS B460 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® Scalable Processors	Cisco UCS B480 M5
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2400/E5-2400 v2	Cisco UCS C22 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600/E5-2600 v2	Cisco UCS C220 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600 v3 & v4	Cisco UCS C220 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® Scalable Processors	Cisco UCS C220 M5
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2400/E5-2400 v2	Cisco UCS C24 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600/E5-2600 v2	Cisco UCS C240 M3
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600 v3 & v4	Cisco UCS C240 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® Scalable Processors	Cisco UCS C240 M5
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E7-2800 v2/E7-4800 v2, v3 & v4/E7-8800 v2 & v4	Cisco UCS C460 M4
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® Scalable Processors	Cisco UCS C480 M5

Operating Environment	Processor	Hardware
Oracle Linux 7.3 64-bit	Intel® Xeon® D-1500	Cisco UCS E1120D-M3/K9
Oracle Linux 7.3 64-bit	Intel® Xeon® D-1500	Cisco UCS E180D-M3/K9
Oracle Linux 6.9 64-bit and Oracle Linux 7.3 64-bit	Intel® Xeon® E5-2600 v3	Dell PowerEdge FC630

**Table 7: Vendor Affirmed Operating Environment**

*CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.*

### 6.3 Vendor Affirmed Environments

The operating system is restricted to a single operator (concurrent operators are explicitly excluded). The application that request cryptographic services is the single user of the module, even when the application is serving multiple clients.

In FIPS Approved mode, the ptrace(2) system call, the debugger (gdb(1)), and strace(1) shall be not used.

## 7. Roles, Services and Authentication

### 7.1 Roles

The roles are implicitly assumed by the entity accessing the module services. The module supports the following roles:

- **User Role:** performs symmetric encryption/decryption, keyed hash, message digest, random number generation, show status, zeroization.
- **Crypto Officer Role:** performs the module installation and configuration, module's initialization, self-tests.

### 7.2 FIPS Approved Operator Services and Descriptions

The below table provides a full description of FIPS Approved services provided by the module and the roles allowed to invoke each service.

U	CO	Service Name	Service Description	Keys and CSP(s)	Access Type(s)
X		Symmetric Encryption/Decryption	Encrypts or decrypts a block of data using 3-Key Triple-DES or AES in FIPS mode	AES or 3-Key Triple-DES Key	R, W, X
X		Keyed Hash (HMAC)	Sign and or authenticate data using HMAC-SHA	HMAC Key	R, W, X
X		Hash (SHS)	Hash a block of data.	None	N/A
X		Random Number Generation	Generate random numbers based on the NIST SP 800-90A Standard	Entropy input string and seed	R, W, X
X		Authenticated Encryption	Encrypt-then-MAC cipher (authenc) used for IPsec	AES key, HMAC key	R, W, X
X		Show Status	Show status of the module state via verbose mode, exit codes and kernel logs (dmesg)	None	N/A
	X	Self-Test	Initiate on demand power-on self-tests by restarting the device which will also clear the RAM memory.	None	N/A
X		Zeroize	Zeroize all critical security parameters when freeing the cipher handler	All keys and CSP's	Z
	X	Module Initialization	Initialize the module into the FIPS Approved Mode	None	N/A
	X	Installation and Configuration	Install and configure the module.	None	N/A
X		Error detection code <sup>1</sup>	Error detection code using crc32c, crct10dif	None	N/A
X		Data compression <sup>1</sup>	Performs data compression using deflate, lz4, lz4hc, lzo, zlib	None	N/A

R – Read, W – Write, X – Execute, Z – Zeroize

**Table 8: FIPS Approved Operator Services and Descriptions**

<sup>1</sup> The algorithms used in this service do not provide cryptographic attribute.

### 7.3 Non-FIPS Approved Services and Descriptions

The following table lists the non-Approved services available in non-FIPS mode.

U	CO	Service Name	Service Description	Keys	Access Type(s)
X		Symmetric Encryption/Decryption	Encrypts or decrypts using non-Approved algorithms	AES-XTS (192-bit key), DES, AES GCM encryption with external IV or aesni implementation	R, W, X
X		Random Number Generation	Generation of random numbers using the ANSI X9.31 PRNG or Jitter RNG.	None	N/A
X		Message Digest	Hashing using hash functions from SHA-1 mb	None	N/A
X		Keyed Hash	HMAC Keys < 112 bits.	HMAC keys < 112 bits.	R, W, X

R – Read, W – Write, X – Execute, Z – Zeroize

**Table 9: Non-FIPS Approved Operator Services and Descriptions**

### 7.4 Operator Authentication

The module is a Level 1 software-only cryptographic module and does not implement authentication. The role is implicitly assumed based on the service requested.

## 8. Key and CSP Management

The following keys, cryptographic key components and other critical security parameters are contained in the module.

CSP Name	Generation	Entry/Output	Storage	Zeroization
AES Keys (128, 192, 256 bits)	N/A	The Key is passed into the module via API input parameter	kernel memory	Memory is automatically overwritten by zeroes when freeing the cipher handler
Triple-DES Keys (192 bits)	N/A	The Key is passed into the module via API input parameter	kernel memory	Memory is automatically overwritten by zeroes when freeing the cipher handler
DRBG Entropy Input String	Obtained from NDRNG	N/A	kernel memory	Memory is automatically overwritten by zeroes when freeing the cipher handler
DRBG internal state (V, key and C values	Derived from Entropy input as defined in NIST SP 800-90A	N/A	kernel memory	Memory is automatically overwritten by zeroes when freeing the cipher handler
HMAC Key ( $\geq 112$ bits)	N/A	The Key is passed into the module via API input parameter	kernel memory	Automatically zeroized when freeing the cipher handle

Table 10: CSP Table

### 8.1 Random Number Generation

The module employs the Deterministic Random Bit Generator (DRBG) based on [SP800-90A] for the random number generation. The DRBG supports the Hash\_DRBG, HMAC\_DRBG and CTR\_DRBG mechanisms. The DRBG is initialized during module initialization. The module loads by default the DRBG using HMAC DRBG with SHA-512 without prediction resistance. To seed the DRBG, the module uses a Non-Deterministic Random Number Generator (NDRNG) as the entropy source. The NDRNG is provided by the Linux RNG using getrandom() system call. The NDRNG provides at least 130 bits of entropy to the DRBG during initialization (seed) and reseeding (reseed). The module performs continuous random number generator test on the output of NDRNG to ensure that consecutive random numbers do not repeat, and performs DRBG health tests as defined in section 11.3 of [SP800-90A].

The module does not provide any key generation service or perform key generation for any of its Approved algorithms. Keys are passed in from calling application via API parameters.

CAVEAT: The module generates random strings whose strengths are modified by available entropy.

## **8.2 Key Entry/Output**

The keys are provided to the module via API input parameters in plaintext form. The keys are not transmitted beyond the physical boundary. The module does not support manual key entry.

## **8.3 Key/CSP Storage**

Symmetric keys and HAMC keys are provided to the module by the calling process, and are destroyed when released by the appropriate API function calls. The module does not perform persistent storage of keys. The RSA public key used for signature verification is stored as part of the module and relies on the operating system for its protection..

## **8.4 Key/CSP Zeroization**

The application that uses the module is responsible for appropriate destruction and zeroization of the key material. The module provides functions for key allocation and destruction. When a calling kernel components calls the appropriate API function that operation overwrites memory with 0's and then frees that memory.

## 9. Self-Tests

FIPS 140-2 requires that the Module perform self-tests to ensure the integrity of the Module and the correctness of the cryptographic functionality at start up. In addition, the module performs conditional test for NDRNG. On successful completion of the power-up tests, the module is operational and the crypto services are available. A failure of any of the self-tests panics the Module and no crypto operations are possible. The only recovery is to reboot the module. See section 10.3 for details.

### 9.1 Power-Up Self-Tests

The module performs power-up self-tests at module initialization without operator intervention. While the module is performing the power-up tests, services are not available and input or output is not possible. The on-demand power up self-tests can be performed by power cycling the Module or by rebooting the operating system. The table below summarizes the power-on self-tests performed by the module. If the known answer does not match the test fails. The different implementations of the same algorithms listed in Table 2 are tested separately by performing the known-answer tests using the same test vectors.

Algorithm	Test
AES	KAT, encryption and decryption are tested separately for the modes ECB, CBC, CTR, XTS, GCM, CCM
Triple-DES	KAT, encryption and decryption are tested separately for the modes ECB, CBC, CTR
SP 800-90A CTR_DRBG	KAT
SP 800-90A Hash_DRBG	KAT
SP 800-90A HMAC_DRBG	KAT
HMAC	(SHA-1, SHA-256, SHA-512) KAT
Module Integrity test	Performed by sha512hmac application with HMAC-SHA-512 provided by NSS
RSA Signature Verification <sup>2</sup>	Part of the integrity test (considered as a KAT)

**Table 11: Power-On Self-Tests**

#### 9.1.1 Integrity Tests

The integrity of the static kernel binary is performed by sha512hmac application using HMAC-SHA-512. At run time, the module invokes the sha512hmac utility to calculate the HMAC value of the static kernel binary file and then compares it with the pre-stored HMAC file in /boot/.vmlinuz-\$(uname -r).hmac.

The sha512hmac application performs its own integrity check by calculating the HMAC value of its binary and comparing it to the HMAC value stored in sha512hmac.hmac. The HMAC-SHA-512 algorithm is provided by the bound NSS module and is KAT tested before the NSS module makes itself available to the sha512hmac application.

The Oracle Linux UEK loadable components (\*.ko referenced in section 3.1) loaded into the Linux kernel during boot time are checked with the RSA signature verification implementation of the Linux kernel to confirm their integrity.

<sup>2</sup> The RSA signature verification is only used as part of integrity test and is not available as a service from the module.

If the HMAC values do not match or the RSA signature verification fails the kernel panics indicating error state.

## 9.2 Conditional Self-Tests

The module performs conditional tests on the cryptographic algorithms shown in the following table:

Algorithm	Test
NDRNG	The module performs conditional self-tests on the output of NDRNG.

**Table 12: Conditional Self-Tests**

## 10. Crypto-Officer and User Guidance

This section provides guidance for the Cryptographic Officer and the User to maintain proper use of the module per FIPS 140-2 requirements.

### 10.1 Crypto-Officer Guidance

To operate the UEK module, the operating system must be restricted to a single operator mode of operation. (This should not be confused with single user mode which is runlevel 1 on Oracle Linux. This refers to processes having access to the same cryptographic instance which Oracle Linux ensures cannot happen by the memory management hardware.)

#### 10.1.1 Secure Installation and Startup

Crypto Officers use the Installation instructions to install the Module in their environment. The version of the RPM containing the FIPS validated module is stated in section 3.1 above.

The RPM package of the Module can be installed by standard tools recommended for the installation of Oracle packages on an Oracle Linux system (for example, yum, RPM, and the RHN remote management tool). The integrity of the RPM is automatically verified during the installation of the Module and the Crypto Officer shall not install the RPM file if the Oracle Linux Yum Server indicates an integrity error. The RPM files listed in section 3 are signed by Oracle and during installation; Yum performs signature verification which ensures as secure delivery of the cryptographic module. If the RPM packages are downloaded manually, then the CO should run ‘rpm –K <rpm-file-name>’ command after importing the builder’s GPG key to verify the package signature. In addition, the CO can also verify the hash of the RPM package to confirm a proper download.

To configure the operating environment to support FIPS perform the following steps:

1. Install the dracut-fips package:

```
# yum install dracut-fips
```

2. Recreate the INITRAMFS image:

```
# dracut -f
```

After regenerating the initramfs, the Crypto Officer has to append the following string to the kernel command line by changing the setting in the boot loader:

```
fips=1
```

If /boot or /boot/efi resides on a separate partition, the kernel parameter boot=<partition of /boot or /boot/efi> must be supplied. The partition can be identified with the command "df /boot" or "df /boot/efi" respectively. For example:

```
$ df /boot
Filesystem      1K-blocks        Used        Available       Use  Mounted on
/dev/sda1          233191     30454        190296      14%        /boot
```

The partition of /boot is located on /dev/sda1 in this example. Therefore, the following string needs to be appended to the kernel command line:

```
boot=/dev/sda1
```

Reboot to apply these settings.

### 10.1.2 FIPS 140-2 and AES NI Support

According to the UEK FIPS 140-2 Security Policy, the UEK module supports the AES-NI Intel processor instruction set as an approved cipher. The AES-NI instruction set is used by the Module.

In case you configured a full disk encryption using AES XTS mode, you *may* use the AES-NI support for a higher performance compared to the software-only implementation.

To utilize the AES-NI support, the mentioned Module must be loaded during boot time by installing a plugin.

Before you install the plugin, you MUST verify that your processor offers the AES-NI instruction set by calling the following command:

```
cat /proc/cpuinfo | grep aes
```

If the command returns a list of properties, including the “aes” string, your CPU provides the AES-NI instruction set. If the command returns nothing, AES-NI is not supported.

You MUST NOT install the following plugin if your CPU does not support AES-NI because the kernel will panic during boot.

The support for the AES-NI instruction set during boot time is enabled by installing the following plugin (make sure that the version of the plugin RPM matches the version of the installed RPMs!):

```
# install the dracut-fips-aesni package
yum install dracut-fips-aesni-*
# recreate the initramfs image
dracut -f
```

The changes come into effect during the next reboot.

## 10.2 User Guidance

CTR and RFC3686 mode must only be used for IPsec. It must not be used otherwise.

There are three implementations of AES: aes-generic, aesni-intel, and aes-asm on x86\_64 machines. The additional specific implementations of AES for the x86 architecture are disallowed and not available on the test platforms.

When using the Module, the user shall utilize the Oracle Linux UEK provided memory allocation mechanisms. In addition, the user shall not use the function `copy_to_user()` on any portion of the data structures used to communicate with the Oracle Linux UEK.

Only the cryptographic mechanisms provided with the Oracle Linux UEK are considered for use. The NSS bound module, although used, is only considered to support the integrity verification and is not intended for general-purpose use with respect to this Module.

### 10.2.1 AES-XTS Usage

The XTS mode must only be used for the disk encryption functionality offered by dm-crypt.

### 10.2.2 AES-GCM Usage

The GCM with internal IV generation in FIPS mode is in compliance with RFC4106 and shall only be used in conjunction with the IPsec stack of the kernel to be compliant with IG A.5. Any other usage of GCM will be considered non-Approved. In case the module's power is lost and then restored, the key used for the AES GCM shall be redistributed.

### 10.2.3 Triple-DES Usage

According to IG A.13, the same Triple-DES key shall not be used to encrypt more than  $2^{16}$  64-bit blocks of data.

## 10.3 Handling Self-Test Errors

The Module transition to error state when any of self-test or conditional test fails. In error state, the kernel is in panic state and the operating system will not load. As such, the output is inhibited and no crypto operations are available in the error state. In order to recover from the error, the module needs to rebooted. If the failure continues, the module needs to be reinstalled.

The kernel dumps self-test success and failure messages into the kernel message ring buffer. Post boot, the messages are moved to /var/log/messages. Use **dmesg** to read the contents of the kernel ring buffer. The format of the ringbuffer (**dmesg**) output is:

alg: self-tests for %s (%s) passed

Typical messages are similar to "alg: self-tests for hmac(sha1-generic) (hmac(sha1)) passed" for each algorithm type.

## 11. Mitigation of Other Attacks

The module does not claim to mitigate against any attacks.

## Acronyms, Terms and Abbreviations

Term	Definition
AES	Advanced Encryption Standard
CAVP	Cryptographic Algorithm Validation Program
CMVP	Cryptographic Module Validation Program
CSE	Communications Security Establishment
CSP	Critical Security Parameter
DH	Diffie-Hellman
DHE	Diffie-Hellman Ephemeral
DRBG	Deterministic Random Bit Generator
ECDH	Elliptic Curve Diffie-Hellman
ECDSA	Elliptic Curve Digital Signature Algorithm
EDC	Error Detection Code
HMAC	(Keyed) Hash Message Authentication Code
IKE	Internet Key Exchange
KAT	Known Answer Test
KDF	Key Derivation Function
NIST	National Institute of Standards and Technology
PAA	Processor Algorithm Acceleration
PBKDF	Password Based Key Derivation Function
POST	Power On Self Test
PR	Prediction Resistance
PSS	Probabilistic Signature Scheme
PUB	Publication
SHA	Secure Hash Algorithm
